

16. READING THE FACE, EYES, TONGUE

DURATION : 14:40

STUDY SHEET

COURSE SUMMARY

This video offers a detailed approach to facial analysis and the signs associated with the eyes and tongue, enabling therapists to visually interpret the overall health status of their patients. Through practical examples, the teaching covers revealing clues such as wrinkles, eye colour, and tongue texture, linking these elements to specific problems of internal organs like the liver, kidneys, and digestive system. You will learn how seemingly innocent characteristics can be indicators of underlying diseases, thus enriching your clinical practice with non-invasive, observation-based assessment tools.

READING THE FACE, EYES, AND TONGUE

Analysing **wrinkles** on the face can reveal information about an individual's state of health. For example, an excess of wrinkles can indicate **dehydration problems** or **anxiety**. The presence of worry lines is often linked to **stomach problems**. A prominent line on the right can signal a **hepatic problem** or **repressed anger**, while on the left, it can be associated with **spleen disorders**. Horizontal lines can also indicate **allergies**.

The colour of the **nose** can also provide clues: a bluish nose can be related to **libido**. **Dark circles** under the eyes, whether bluish, brown, or swollen, can signal **kidney deficiency** or a problem with urea elimination. A dark blue can be a sign of a **depressive problem**, while a yellow tint can indicate a **hepatobiliary problem**. Brown or black dark circles require a consultation to check the state of the **pancreas**.

Crow's feet lines can reveal deeper organic imbalances, particularly in the kidneys, liver, or stomach. Small burst venules can indicate a need for **oxygenation** and require an assessment of the liver and intestine. A red **nasal tip** can be linked to heart problems, while prominent lines can be associated with the **pancreas**.

In women, an irregular chin can signal **hormonal imbalances**. The **lips** can also provide information: pursed lips can indicate gastric problems, while thickening can also be a sign of gastric disorders. **Angular cheilitis** can signal **candidiasis**, and very red lips can indicate **vitamin B depletion**.

Dryness of the skin around the nose can be a sign of **pre-cancer**. The lips themselves reflect the intestinal state, and spots can indicate intestinal or heart problems. Bluish lips can signal a pulmonary problem or insufficient **oxygen absorption**.

The **eye** is often considered a reflection of general health. The **Tenon's capsule** and the relationship between the eye and the body's fascia are essential. An ocular imbalance can influence posture. Eye colours, such as the yellow of the sclera, can indicate hepatic or biliary problems. A blue-white sclera can signal a pulmonary problem, while a brown colour can indicate **absorption** problems in the liver.

Conjunctivitis or a **stye** can be linked to infections or mineral deficiencies. The immune system plays a crucial role in digestive health, and problems with the eyelids can indicate kidney disorders.

Regarding the **tongue**, a pink, mobile, and fresh tongue is ideal. A very red tongue can signal heart problems, while a white tongue can indicate gastric disorders. The coating of the tongue, which is usually posterior, reflects the state of gastric, hepatic, or colonic health.

Deposits on the tongue can signal problems in the colon or lungs. A very smooth or painful tongue can indicate vitamin deficiencies. A deviated tongue can signal paralysis of a cranial nerve.

The colour of the tongue is a key indicator of internal states. A white tongue can signal **cold** in the body, while a yellow tongue can indicate **dampness**. A red tongue signals an **excess of fire**, and a black tongue can indicate **toxaemia**.

The evolution of tongue colour can reflect the depth of a pathology. Deposits on the tongue often reflect the state of the stomach. Medications can also influence the appearance of the tongue, and it is important to consider these factors when assessing a patient's health.
