

36. DEVELOPMENT OF THE COLON : INTRO

DURATION : 00:54

STUDY SHEET

COURSE SUMMARY

This video explores the development of the colon, considered a space of revelation for our digestive health. You will learn key concepts such as the 'colon tai chi', which connects the caecum to the dynamics of the duodenum, while highlighting the importance of liver movement and the vitelline vesicle. This course emphasises the crucial interaction between the brain and the heart, showing how these elements align to rebalance the digestive tract and improve our well-being. An essential integrative approach for students and practitioners in biodynamic embryology and osteopathy.

COLON DEVELOPMENT

The mind and body are hidden in the **colon**. The word **colon** comes from "coleone", meaning infinity.

We will briefly discuss the **caecum**, which has a digestive adaptive capacity. It is a place of revelation, the verdict of your diet.

We will explore the **colon's tai chi**, linking it to the **duodenal** framework. Remember that the main driver of this process is the movement of the **liver**, as well as that of the **lesser sac** (omental bursa) and the establishment of the **stomach**.

In parallel, a movement occurs at the level of the **vitelline vesicle**. The great fulcrum of this dynamic lies in the interaction between the **brain** and the **heart**, allowing us to go even further in this exploration.

In this developmental phase, we observe how all of this completely organises the **digestive tract**. This involves a rebalancing of the dynamic between the brain, the heart, and the return to the vitelline vesicle.
