

18. READING NAILS, HANDS, CONDITION, HAIR

DURATION : 03:40

STUDY SHEET

COURSE SUMMARY

In this captivating video, you will learn to read the signals your body sends through your nails, hands, and hair. The training focuses on nail angulation, the different lines that indicate nutrient and absorption problems, as well as the impact of infections on mineral health. You will also discover indications of thyroid and liver imbalances through the condition of the hands and hair, with practical advice for assessing related health problems. By combining physical observations and knowledge of biodynamic embryology, this integrative approach will allow you to refine your diagnosis and adopt a more targeted treatment strategy.

READING NAILS, HANDS, CONDITION, AND HAIR

Regarding the **nails**, the **normal angulation** is approximately **165 degrees**. An inversion of this angulation can indicate a **sign of pulmonary failure**. Nails that are often **brittle** or **bitten** are typical of nervous individuals or children who are bored.

Horizontal lines on the nails can signal difficulties with **nutrient absorption**, while **vertical lines** indicate poor intestinal absorption. Small dots on the nails can be linked to **mineral deficiencies**, particularly in **zinc**, **iron**, and **copper**. In case of infection, the body uses these minerals, found in bones and nails, to mobilise **white blood cells**.

Once the infection is cleared, the minerals are also eliminated. Nails showing inversion can signal **fragile lungs** and **heart**. A marked stop on the nails can indicate either a **fungus** (immune deficiency) or a deep **metabolic problem**.

Spoon-shaped nails can express a problem with **iron absorption** or **storage**, often linked to red blood cell degradation. The absence of the **lunula** (the small white area at the base of the nail) can indicate a lack of **vitality**. Pressing on the nail, it whitens then regains its colour, which is a good sign.

A **yellow nail** is a sign of a **fragile liver**, while a **blue nail** can indicate a heart or lung problem. If the **lunula** is bluish, this can signal a **disturbed liver**, and if it is red, it could be an early sign of a heart problem, especially if the tip of the tongue is very red.

Sweaty and cold hands can indicate a **thyroid** or liver **imbalance**. For example, a thin person with bulging eyes and sweaty hands often presents with a thyroid imbalance. It is important to also check the **adrenals**, as adrenal exhaustion can affect the conversion of **T3** to **T4**.

Chills can be a sign of exhaustion of the kidneys' **ancestral energy** or a problem with **hypothyroidism**. **Grey hair** in a young person can indicate an imbalance in the **absorption** of certain **amino acids**, which requires an evaluation of the intestines and liver. Furthermore, discolouration of the **eyebrows** can be a sign of **food allergy** or other problems.
