

19. PRACTICE : THE FACE

DURATION : 07:11

STUDY SHEET

COURSE SUMMARY

In this video, we delve into the practice of rebalancing the face in relation to the brain, exploring the lines of force between the neurocranium and the viscerocranium. Key concepts discussed include the importance of the nervous and visceral systems, as well as the need to release areas such as the pelvis and mediastinum before addressing the cranium. The method focuses on a biodynamic approach that promotes a light touch, allowing tensions to be released while preserving bodily integrity. This session offers concrete tools to facilitate harmony and bodily unity in the patient, while integrating elements of consciousness and sensation. Essential learning for any practitioner wishing to improve their skills in osteopathy and biodynamic embryology.

FACIAL PRACTICE: REBALANCING AND BIODYNAMICS

In this session, we will explore the **lines of force** that connect the periphery of the face to the base of the skull, with the aim of rebalancing the face in relation to the brain. The **neurocranium** and the **viscerocranium** articulate at the **sphenobasilar symphysis**, which necessitates an integrated treatment of both.

It is essential to consider the **nervous system** in connection with the **visceral system** to establish balance. When a baby transitions from the umbilical to the oral region, they must be able to gather all information at the mouth. If a baby cannot gather themselves, it is crucial to help them regain this **harmony** so that they can bring elements back to their **midline**.

A child, in fact, becomes very **oral**, as the mouth represents a survival zone. They need a point of support, whether sitting or lying down. In my treatments, I generally start with the **pelvis**, the **viscera**, and avoid treating the cranium too early. If I need to intervene at the cranium, I favour a point of support at the jaw, avoiding direct contact with the head.

It is paramount to **relax** the pelvis, sacrum, and digestive area. If necessary, I also ensure the **mediastinum** is relaxed. When I work on the cranium, I do so very lightly, taking care of the **dural sheath**. The lighter the touch, the deeper it allows access to anatomical structures.

I let the anatomy reveal itself through my body, becoming aware of densifications that may indicate a stronger electrical field. By touching the periphery, I may feel deviations or tensions, but I remain focused on a **biodynamic** approach. My intention is to stay with health, without

being distracted by lesions.

When I feel a tension, I do not engage with it directly. I maintain a global view and focus on the **pattern of health**. I can then adjust my contact frequency, moving from the skin to the bone tissues, while remaining attentive to the person's sensations.

It is important to maintain **stillness** while being aware of the different densifications. I focus on the dural sheath and its thickening, while remaining within a global approach. I seek to establish a connection between the different structures, particularly at the **coronal suture**.

By working lightly, I can help the person feel a **unity** in their body. If old memories manifest, such as tensions or pains, I gently release them. This allows for the clearing of bodily **memories** without causing excessive pain.

In conclusion, this biodynamic approach aims to release tensions while respecting the body's integrity, thus allowing for a harmonious rebalancing of the face and cranium.
